

How Verillian helps drive compliant adoption of frontier AI for legal teams

Privilege, work product, bar and ethics duties

Lawyers and legal staff want AI for research, drafting, document review, contract work, and matter summaries. Privilege, work product, and client confidences still travel with the work, so adoption needs a record and a boundary. **Verillian runs in your environment and governs what AI may do with matter data on the device. Sensitive material is redacted on a best-effort basis before a call leaves, and each captured interaction is sealed into a tamper-evident record only your firm can read.**

WHAT THE READER CAN EVALUATE

Keep matter data on your hardware	Verillian is self-hosted between your people and every model. There is no Verillian cloud in the path, and Verillian never receives your data.
Deny by default on privileged work	Policy can let AI draft and summarize while blocking export of a matter file or other restricted material.
Redact before a call leaves	Client identifiers and sensitive strings are stripped in place on a best-effort basis before content reaches a model provider.
Hold a sealed record	Every captured interaction is signed and hash-chained, sealed under a key only your firm holds.

The record

Built to help you meet attorney-client privilege, work-product protection, and bar and ethics duties. Those duties are yours to satisfy. Verillian provides the on-device controls and the sealed record to support them.

Use this brief to frame a pilot around AI adoption, policy enforcement, and evidence your team holds.

Verillian is self-hosted with customer-held keys and tamper-evident records.
